

INVO[®] Feeder

Reliable tail feeding system for the paper and board industry

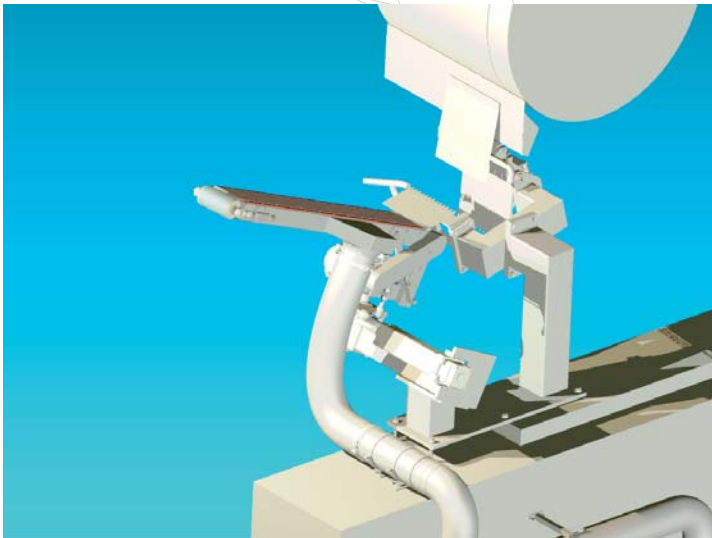

The INVO® Feeder is the most reliable system on the market when it comes to paper and board threading.

The system consists of a steel base on which a vacuum conveyor is mounted. An air-fan creates a vacuum on the top side of the conveyor that holds the forward running tail on the belt when operating. The combination of UMV clean design and unique technology gives an optimized tail run with minimized losses.

A pneumatic operated tail knife is mounted behind the conveyor. The tail knife cuts the tail when the INVO® Feeder is activated and three blower nozzles blows the tail into accurate position.

In the movable version of the INVO® Feeder the conveyor can be put in operation or in "home" position.

Benefits with the INVO® Feeder;

- outstanding runnability
- clean & proven design
- cost effective solution
- safe to operate
- low maintenance needs
